

bGuarded™ – Distributed Denial of Service Attack Mitigation Platform

BurstNET's® **bGuarded™** is a multi-gigabit DDoS mitigation platform designed to provide protection from a broad range of DDoS attacks:

- HTTP
- DNS
- SIP (VoIP)
- TCP-based
- UDP-based

bGuarded utilizes a sophisticated hardware based multi-verification process to provide granularity and accuracy in differentiating between hostile and legitimate traffic. This ensures that your site is ready and available to serve your users.

BurstNET offers bGuarded in two levels:

- **bGuarded Standard** – bGuarded Standard is included with all hosting plans. bGuarded Standard's anomaly recognition is tuned to BurstNET's overall traffic pattern and provides general protection against a variety of attacks.
- **bGuarded Premium** – bGuarded Standard may not be suited for all system's traffic patterns. In some case it may not be stringent enough. bGuarded Premium is tuned to your site's, or hosted network's traffic pattern. BurstNET's engineers will develop a custom traffic profile, allowing bGuarded to provide a protection that fits your needs.
